AB	Disclosed are novel compds. extracted and isolated from a plant belonging to Compositae. Compds., such as (1S,3R,4S,6R,7S,8R,10R)-1-hydroxy-3-methoxy-3,10-epoxy-8-isobutyryloxygermacra-11(13)-en-6,12-olide, (4S,5R)-4-hydroxy-4-[(1E,3S)-3-hydroxy-1-butenyl]-3,3,5-trimethylcyclohexanone, and (1S,3R,6R,7R,8R,10R)-1-hydroxy-3-methoxy-3,10-epoxy-8-isobutyryloxygermacra-4,11(13)-en-6,12-olide, were identified from the exts. and in vitro antitumor activities against human acute lymphoid leukemia cell (HL-60) were tested.

AB The new sesquiterpene lactones I and II (R = H or 1- β -D-glycosyl), together with the known sesquiterpene lactones tatridin-A, -B, and dihydro- β -

cyclopyrethrosin, and the known flavonoids jaceidin, apigenin, luteolin, apigenin-7-galacturonic acid Me ester, and apigenin-7-glucuronic acid were isolated from the flowers of *Chrysanthemum cinerariaefolium*. The structures of I and II were determined by standard chemical and spectral methods. All the compds. isolated inhibited the root growth of Chinese cabbage seedlings.

AB Comps., which show increased absorption of fat-soluble components from small intestine, are manufactured by letting mixts. of diacylglycerols with emulsifiers contain herbal medicine components. Thus, a composition prepared by heating 100 g diacylglycerol with 5 g lecithin and 1 g tetrahydrocurcumin was made into soft capsules.

AB Studies on the chemical constituents of the aerial parts of *Pterocaulon redolens* (Forst.f) F. Vill. (Asteraceae) resulted in the isolation of ten

components: seven coumarins [5-methoxy-6,7-methylenedioxy coumarin (1), ayapin (2), puberulin (3), 5-methoxyscopoletin (4), 2',3'- dihydroxypuberulin (5), isofraxidin (6), and 5-(2',3'-dihydroxy-3'- methylbutyloxy)-6, 7- methylenedioxy coumarin (7)] and three flavonoids [luteolin (8), tomentin (9), and chrysosplenol C (10)], among which 5 was firstly isolated as a natural product. The full ¹H- and ¹³C-NMR spectral assignments for the isolated products, including revision of previous assignment in the literature are reported. Six coumarins (1-4, 6, and 7) and one flavonoid (8) displayed mild activity against *Mycobacterium tuberculosis* H37Ra. In addition, flavonoid (10) was firstly found to possess moderate cytotoxicity against breast cancer (BC) and human small cell lung cancer (NCI-H187) cell lines.

AB Screening using a reporter under the control of the hypoxia-response element (HRE) identified several flavonoids and homoisoflavonoids that inhibit the activation of HRE under hypoxic conditions. Among various compds., isorhamnetin, luteolin, quercetin, and Me ophiopogonanone B (MOB) were effective at 3 to 9 μ g/mL in inhibiting the reporter activity. The expression of vascular endothelial growth factor (VEGF) mRNA during hypoxia was also inhibited by MOB in HepG2 cells, but the EDs were 10 to 20 μ g/mL. MOB caused destabilization of hypoxia-inducible factor (HIF)-1 α , as revealed by Western blotting, that was dependent on proteasome activity and the tumor suppressor, p53. The tubular formation and migration of human umbilical vein endothelial cells was also inhibited by MOB. MOB is expected to act as an inhibitor of angiogenesis.

AB We investigated the anti-proliferative effects of luteolin and apigenin, isolated from *Ixeris sonchifolia* Hance, on HepG2 human hepatocellular carcinoma cells. In MTT assay luteolin showed more efficient anti-proliferative effects on cells than apigenin did. According to propidium iodide staining and flow cytometry studies, we postulated that these effects might be a result of cell cycle arrest. Hence we examined the changes of protein expressions related to cell cycle arrest. Western blotting data demonstrated that the down-regulated expression of CDK4 was correlated to the increase of p53 and CDK inhibitor p21WAF1/CIP1 protein. These data suggest that luteolin may have potential as an anti-cancer agent.

- AB Bioassay (P388 lymphocytic leukemia cell line and human cancer cell lines)-guided separation of an extract prepared from the leaves of *Hymenaea palustris* Ducke led to the isolation of six cancer cell growth inhibitory flavonoids (1-6). The structures were elucidated by HRMS and 1D and 2D NMR spectral anal. The new flavonolignan I, designated palstatin, proved to be a methoxy structural modification of 5'-methoxyhydnocarpin-D (2). Flavones 1-4 inhibited growth of the pathogenic bacteria *Enterococcus faecalis* and/or *Neisseria gonorrhoeae*.

- AB Lin-nan-yeh-chu, is the dried entire plant of *Vernonia paltula* (Compositae) and used as folk medicine in Taiwan. To evaluate the quality of *V. paltula*, a simple, rapid, and accurate high-performance liquid chromatog. (HPLC) method

was developed for the assay of 4 flavonoids apigenin (API), apigenin-7-O-glucoside (APG), luteolin (LUT), and luteolin-7-O-glucoside (LUG). The present HPLC system uses an Inertsil ODS-2 column by gradient elution with acetonitrile and 0.1% (volume/volume) phosphoric acid as the mobile phase. Et paraben was used as an internal standard and detected at 254 nm. Regression equations revealed good linear relationships (correlation coeffs.: 0.9998-0.9999) between the peak-area ratios of each constituent to Et paraben. The recovery of 4 marker constituents ranged from 89.3 to 95.6%. The contents of the 4 constituents in stem, flower, leaf, and root parts of *V. paltula* were compared. Leaf part consisted of the highest contents of flavonoids except for APG which is less than that in the flower. The root and stem only showed trace amount of APG but not the other 3 flavonoids. The contents of 4 constituents were 0.6016, 0.0042, 0.2160, and 0.0577 mg/g for apigenin-7-O-glucoside, apigenin, luteolin-7-O-glucoside and luteolin, resp. HPLC chromatograms of another 3 plants of genus *Vernonia* in Taiwan, *V. cinerea*, *V. elliptica* and *V. gratiola*, were also compared.

AB Citrus fruits contain high concns. of several classes of phenols, including numerous hydroxycinnamates, flavonoid glycosides, and polymethoxylated flavones. The latter group of compds. occurs without glycosidic linkages and has been shown to inhibit the proliferation of a number of cancer cell lines. This antiproliferative property was further demonstrated against addnl. human cancer cell lines, and the antiproliferative actions of a series of synthetic methoxylated flavones were also studied. Similar to the naturally occurring compds., the synthetic compds. exhibited strong antiproliferative activities.

In many cases the IC50 values occurred below 10 μ m. Other hydroxylated flavone and flavanone aglycons also exhibited antiproliferative activities against the cancer cell lines, with the flavones showing greater activities than the flavanones. Glycosylation of these compds. removed their activity. The strong antiproliferative activities of the polymethoxylated flavones suggest that they may have use as anticancer agents in humans.

AB The methanolic extract of roasted safflower seeds exhibited moderate cytotoxicity against three cancer cell lines, HepG2, MCF-7, and HeLa, in a dose-dependent manner, as measured by MTT assay. The methanolic extract was further partitioned with n-hexane, Et acetate and n-butanol successively. The Et acetate fraction exhibited potent cytotoxicities against the cancer cell lines. N-Feruloylserotonin (S1), N-(p-coumaroyl)serotonin (S2), matairesinol (L1), 8'-hydroxyarctigenin (L2), luteolin (F1), and acacetin (F2) were isolated from the Et acetate extract, and their chemical structures were identified by UV, IR, NMR, and MS spectroscopic methods. Six phenolic compds. possessed comparable cytotoxicity against three cancer cells. In particular, F1 and F2 had the most potent cytotoxicity with IC50 values of 51.8 and 62.1 μ g/mL for HeLa cell, 33.6 and 37.7 μ g/mL for MCF-7 cell and 47.3 and 56.6 μ g/mL for HepG2 cell, resp. In addition, L1, L2, S1, and S2 also showed strong cytotoxicity, although activities of serotonins were weaker than those of lignans. On normal human liver cell (WRL68) at a high concentration of 100

µg/mL, two serotoninins and lignans did not show any cytotoxicity, and two flavonoids exhibited only about 50% cytotoxicity. These results suggest that phenolic compds. in the safflower seeds may be useful as potential cancer chemopreventive agents.

AB It is always important for the chemist to have good methods of separation, characterization and quant. evaluation for one or several compds. resulting from a chemical reaction or an extraction procedure. In this domain the chromatog. techniques are choice methods, in particular Over Pressured Layer Chromatog. (OPLC) and Automated Multiple Development (AMD). They are relatively recent methods whose use is unfortunately not yet generalized although they give very clean separation. In this paper we present numerous examples of the use of these two new types of planar chromatogs. and especially the results we have obtained in the field of natural products on a wide variety of different structures: coumarins, flavonoids, anthocyanins, alkaloids and essential oils.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB Activity-guided fractionation of an Et acetate extract of the aerial parts of *Tithonia diversifolia*, using an antiproliferation bioassay performed with human colon cancer (Col2) cells, led to the isolation of three new sesquiterpenoids, 2 α -hydroxytirotundin (I), tithofolinolide (II), and 3 α -acetoxydiversifolol (III), along with eight known sesquiterpene lactones, 3 β -acetoxy-8 β -isobutyryloxyreynosin (IV), tagitinin C (V), 1 β ,2 α -epoxytagitinin C (VI), 4 α ,10 α -dihydroxy-3-oxo-8 β -isobutyryloxyguaia-11(13)-en- 12,6 α -olide (VII), 3 α -acetoxy-4 α -hydroxy-11(13)-eudesmen- 12-oic acid Me ester, 17,20-dihydroxygeranylnerol, tagitinin A, and tirotundin. These isolates were evaluated for their potential as cancer chemopreventive agents, by measuring antiproliferative activity in Col2 cells and induction of cellular differentiation in human promyelocytic leukemia (HL-60) cells. Selected compds. were then investigated for their ability to inhibit 7,12-dimethylbenz[a]anthracene-induced preneoplastic lesions in a mouse mammary organ culture assay. Among these isolates, V and VI showed significant antiproliferative activity, II, IV, and VII induced HL-60 cellular differentiation, and IV significantly inhibited (63.0% at 10 μ g/mL) lesion formation in the mouse mammary organ culture assay. The chemical structures of I-III were elucidated by spectroscopic anal. The absolute configurations of I and II were determined by Mosher ester methodol.

AB For the purpose of quality anal., we investigated polar constituents as marker substance for some traditional herbs. From *Daphnis Genkwa* Flos twelve flavonoids were isolated. They were identified as potassium apigenin 7-O- β -D-glucuronate (1), apigenin 7-O- β -D-glucuronide (2), apigenin 7-O- β -D-methylglucuronate (3), apigenin (4), genkwanin 5-O- β -D-primeveroside (5), genkwanin 5-O- β -D-glucoside (6), genkwanin (7), tiliroside (8), kaempferol (9), luteolin 5-O- β -D-glucoside (10), luteolin (11) and 7-O-methyl-luteolin (12). Among them, 2, 3, 5, 6, 9 and 10 were known compds., but were for the

first time isolated from this material. Compound 1 was isolated from nature for the first time. The structures of 1-12 were established on the basis of their phys. properties and spectroscopic evidence. Treatments of human hepatoma HepG2 cells with 0.1 mM apigenin, luteolin, and 7-O-methyl luteolin for 48 h caused 40% reduction on cell viability, whereas potassium apigenin 7-O- β -D-glucuronate, luteolin 5-O- β -D-glucoside, genkwanin, genkwanin 5-O- β -D-primeveroside, and tiliroside caused little or no effects on the viability of HepG2 cell. These data suggest a rough structure-activity relation of flavonoid cytotoxicity.

AB Twenty-six flavonoid aglycons have been identified from eight plants covering three species of *Chrysothamnus* that were collected in eastern Oregon. The flavonoids were identified by NMR spectroscopy, tandem mass spectrometry and co-TLC with authentic markers. *Chrysothamnus nauseosus* yielded Me ethers of apigenin, isoscutellarein, luteolin, kaempferol, herbacetin and quercetin. O-Methylated kaempferol and quercetin derivs. were isolated from the leaf exudate of *C. humilis*. The flavonoid chemical of *C. viscidiflorus* was found different from the other two species by the presence of Me ethers of quercetin, eriodictyol and taxifolin-3-acetate. Although the flavonoid profiles proved of diagnostic value at the species level, they provided little further evidence in favor of inclusion of *Chrysothamnus* into *Ericameria* as proposed earlier on the basis of morphol. similarities.

AB A micellar electrokinetic capillary chromatog. (MEKC) method with diode-array detection is developed for the characterization of pharmacol. active flavonoids in exts. prepared from *Epimedium brevicornum*, *E. humanense*, *E. coactum*, and *E. truncatum*. The pKa values of icariin, epimedin B, and epimedin C are determined by spectrophotometry. Optimal separation of icariin, epimedin B and C, and eight other compds. is achieved by determining pKa values and by systematically optimizing electrolytic and instrumental parameters. The repeatability of analyses and the reliability of identifications are evaluated by the marker technique. Calculated for relative migration times of flavonoids in the exts., the repeatability of the analyses varies from 0.7 to 6.4% (nine replicates). For migration indexes calculated with two markers, however, the repeatability almost falls below 0.5%. The distribution of the flavonoids is found to differ both qual. and quant. among the four species. The MEKC technique appears to provide a powerful tool for the identification and quality control of plant drugs and for phytotaxonomic investigations.

AB Thirty-seven kinds of spices were extracted with n-hexane, Et acetate and methanol to obtain the corresponding 111 exts. Each extract was examined for antitumor-promoting activity on 12-O-tetradecanoyl-phorbol-13-acetate (TPA)-enhanced 3H-choline incorporation into phospholipids of C3H10T1/2 cells in vitro and on TPA-induced mouse ear edema in vivo. Among the tested spices, Basil, Ginger, Marjoram, Rosemary, White Pepper and Xiebai significantly inhibited TPA-enhanced 3H-choline incorporation into phospholipids of C3H10T1/2 cells. Allspice, Basil, Bay (Laurel), Cardamom seed, Cinnamon, Cumin, Dill seed, Dry ginger, Ginger, Japanese parsley, Horse-radish, Marjoram, Oregano, Parsley, Pink pepper, Red pepper, Rosemary, Sage, Tarragon, Thyme, Turmeric and White pepper were highly potent inhibitors of TPA-induced mouse ear edema. Moreover, antitumor-promoting activity-guided the separation of the relatively active spices led to the isolation of four compds., including ursolic acid from Sage, luteolin from Celery seed, laxogenin from Xiebai and piperine from White pepper. These compds. along with capsaicin were also found to inhibit TPA-induced mouse ear edema.

DOCUMENT TYPE: Journal

LANGUAGE: English

AB Chemical constituents from capitate glandular trichomes were analyzed for 33 of the 38 species of *Pappobolus*. In total, 35 HPLC peaks were detected, 30 of which could be tentatively assigned to known compounds. Of the sesquiterpene lactone and benzofuran type. Compounds of the 1-keto-2,3-unsaturated-furanoheliangolide type (budleins) were present in all plants and quantitatively dominated the compound patterns. Several other heliangolides were also present. Xanthanolides were detected in about 50% of the species, and benzofurans from about two-thirds of them. *Pappobolus* is the only genus for which benzofurans have been demonstrated to occur in capitate glandular trichomes. Overall there was a high degree of chemical homogeneity, which is in accord with the suggestion that *Pappobolus* is monophyletic and of relatively recent origin. *Pappobolus* is distinct from other genera of the subtribe Helianthinae in the occurrence of xanthanolides and in the lack of germacrolides and eudesmanolides.

AB In the course of an investigation of the widespread Compositae family, five medicinal plants from Rwanda were studied. Those plants were particularly screened for an showed moderate antimicrobial and significant cytotoxic activities. Most of the active principles were found to be highly oxygenated sesquiterpene lactones, e.g., tagitinin C and F. In one case, a polyhydroxylated sapogenin was responsible for the cytotoxic activity. Some flavonoids were also isolated along with the sesquiterpene lactones.

AB Twenty-four sesquiterpene lactones and 4 benzofurans were isolated and identified in glandular trichomes of 3 Pappobolus species. Among them several new furanoheliangolides and xanthanolides were found. The localization of benzofurans together with the sesquiterpene lactones in special glandular hairs of the leaf surface and parts of the inflorescence was demonstrated. A recently developed microsampling technique allowed for a rapid survey and selection of the plant material in order to obtain information on the whole genus for a chemotaxonomic investigation.

AB A chemical anal. of the resinous content of capitate glandular trichomes from the leaf surface of *H. tuberosus* established the existence of 19 sesquiterpene lactones. Despite a high degree of intraspecific variation, comparison of the compound patterns of 12 different specimens by means of a microsampling technique and successive HPLC anal. indicated the occurrence of two chemotypes with distinct sesquiterpene lactone profiles. While plants of the one type are characterized by the dominance of 1,10-epoxidized heliangolides, the second group is composed of specimens which particularly accumulate 1-keto-2,3-unsatd.-furanoheliangolides. Biosynthetic and chemotaxonomic aspects are briefly discussed.

 AB Counter-current chromatog. is a new liquid-liquid partition chromatog. without using solid support. The capability of this high-speed counter-current

chromatog. was demonstrated on separation of 2 sets of samples obtained from medicinal herbs: a synthetic mixture of 3'-hydroxygenkwanin, luteolin and apigenin was separated on a 2-phase solvent system composed of CHCl₃-MeOH-H₂O(4:3:2) and a crude EtOH extract from *Anisodus tangulicus* [CHCl₃-pH 6.4 0.07M Na phosphate (1:1)]. In the light of chromatograms obtained from these samples, advantages of high-speed counter-current chromatog. over other chromatog. methods were discussed in terms of partition efficiency, peak resolution, separation time, sample loading capacity, etc.

AB The aerial parts of *G. resinosa* afforded, in addition to known compds., 22 new ones: 9 germacranolides, 7 eudesmanolides, 5 guaianolides, and a bisabolene derivative. The structures were elucidated by spectroscopic methods and by some chemical transformations including partial synthesis. The chemotaxonomic situation of *Greenmaniella* and the biogenetic relationships of the compds. are discussed briefly.

AB The name caleinolides is suggested for a class of heliangolides from *Calea* and *Neurolanea* species. The finding is based on NMR spectra of 58 compds. and on chemical conversions. Neurolenin A and B (Vazquez Bueno, P., et al., 1982) were the reference compds. The structures are characteristic for trans-heliangolides. The OH or ester groups at C-8 and C-9 are trans, with orientations 8 β and 9 α .

AB The stereochem. previously assigned (Chowdhury, P. K., et al., 1980) to cyclotagitinin C (I) was confirmed. Epoxidn. of anhydrocyclotagitinin C (II) gave two epoxides; the α -epoxide with Lewis acids resulted in epoxide ring opening with retention of configuration and in rearrangement to a diketone III, whose structure was confirmed by x-ray crystallog. Analogous reactions of

the β -epoxide resulted in epoxide ring opening with inversion of configuration.

AB From a cytotoxic extract of *E. semiserratum*, 5 flavones were isolated. Three of these were characterized as the previously known pectolinarigenin, and 2 new flavones, eupatorin and eupatilin. Structural studies are described which led to assignment of the 3',5-dihydroxy-4',6,7-trimethoxyflavone structure for eupatorin, and the 5,7-dihydroxy-3',4',6-trimethoxyflavone structure for eupatilin. From a cytotoxic extract of *E. cuneifolium*, 2 flavones were isolated, characterized as the previously known hispidulin and a new flavone, eupafolin. Structural studies are described which led to assignment of the 3',4',5,7-tetrahydroxy-6-methoxyflavone structure for eupafolin. The earlier assignment of this structure for pedalitin is shown to be incorrect, and the alternative 3',4',5,6-tetrahydroxy-7-methoxyflavone structure is proposed for pedalitin.

AB A method for the identification of flavones and their glycosides on a micro scale is described. When applied to the compds. extracted from the flower of the blue dahlia "Dandy," the presence of 6 bands, containing apigenin (I), its 4'- (II) and 7-monoglucoside (III) and 7-rhamnoglucoside (IV), and the 5'-monoglucoside (V) and 7-diglucoside (VI) of luteolin; the arabinoglucoside of cyanidin (VII), and a few minor compds. has been demonstrated. Although the complex mixture of phenolic glucosides present in many petal exts. may readily be separated by paper chromatog., the individual compds. cannot usually be identified by their Rf values or color reactions alone. Attempts were therefore made to sep. the mixture before examination of the individual components. The authors have found that provided the solvent is removed from the developed paper chromatograms at room temperature individual bands can be quant. eluted in 24-48 h. with aqueous alc. These extracted bands may then be further purified, if necessary, by use of a 2nd solvent. Thus, (88.5 g.) of Dandy petals was crushed under 400 ml. 0.01N HCl-EtOH, kept at 0° 1 wk, filtered, the extract (10 ml.) applied as a streak from a teat pipet in 0.5-1 ml. portions to Whatman's Number 3 paper (22 x 18 in.), which had been previously washed 24 h. with H2O, in a chromatog. cabinet, dried at room temperature, the chromatogram developed overnight with BuOH-AcOH-H2O (61:2), carefully dried in a current of air in a fume cupboard, the position of the bands marked under an UV lamp, the separated components were eluted from the paper in a conventional chromatog. tank with either cold aqueous alc. (40-70%) for the flavones, or cold aqueous dilute HCl for the anthocyanins, and each of the resulting solns. was concentrated to a small volume in vacuo, purified by rerunning in the same solvent system, and eluted as before. The purified bands were then treated for homogeneity on Whatman's Number 1 paper in other solvents, and, when mixture, they were separated in a similar way so that used for the original extract Band 1 was eluted with 70% alc.; removal of most of the alc. left a dark brown solid, crystallizing from aqueous alc. in pale yellow crystals, m. 340°, identified as I, comparison of its Rf value, color reactions, and mixed m.p. with authentic synthetic I. Band 2 was shown to be a monoside by its RM value $[RM = \log (1/Rf) - 1]$, varying directly with the number of functional groups], and on methylation (to determine the position of the sugar moiety) with Me2SO4, and anhydrous K2CO3 in dry Me2CO and subsequent hydrolysis yielded a compound, which, since it gave a neg. FeCl3 reaction, was presumably tetra-O-Me luteolin. Since glucosides in which the sugar is attached in the 4' or the 7-OH group in flavones are not affected under the above conditions, it appeared that band 2 was due to a 5'-glucoside. Upon methylation with CH2N2 it yielded a product giving a neg. FeCl3, test, and on hydrolysis with acid, the sugar-free Me ether gave a dark brown color with FeCl3, proving the presence of a 5'-HO group. Band 2 was V. Band 3 gave a mixture of components, separated in BuOH-H2O; and giving, when methylated and hydrolyzed, a product separated on impregnated paper with BuOH-H2O into 2 aglycons, whose Rf values and color reactions were identical with those of 4',5- and 5,7-di-O-methylapigenin. The spectra of this methylated product in 0.002M EtONa also indicated the presence of 2 components (II and III). III (cosmetin) had the same Rf value as authentic synthetic III in all solvents tried. II has not previously been reported. Band 4: the major component was shown to be a rhamnoglucoside of apigenin, and on quant. examination gave an apigenin: sugar ratio 1:2.2. Methylation followed by hydrolysis gave a product identical with 4',5-di-O-methylapigenin; partial hydrolysis gave IV, whose m.p., Rf value, color reaction, and spectra were identical with those of "rhoifolin." Band 5 yielded 2 components, the major component being a luteolin diglucoside. Methylation and hydrolysis showed that the sugar was at the 7-position and, unlike band 2, band 5 gave a brown color with FeCl3 solution before hydrolysis, showing the 5-HO group is free. Thus band 5 is VI. No compound of this nature has as yet been reported. The 2nd component gave on

hydrolysis glucose and a mixture of 2 aglycons, neither of which has as yet been identified. The anthocyanin band 6 was separated into 2 components with iso-PrOH-2N HCl. The major component on hydrolysis yielded cyanidin, arabinose, and glucose. It is probably a 3,5-diglucoside, but owing to fading of the aglycon at low concentration a quant. determination was not possible. The 2nd anthocyanin was present in too low a concentration for complete identification, but on hydrolysis gave an aglycon undistinguishable from pelargonidin. Tables of the Rf values and color reactions for the 6 bands are given.
